## Important

The information listed here in is correct to the best of the Company's knowledge and belief, having been compiled from reliable and official sources of information.

However we cannot assume any responsibility for possible errors.

Please refer to your Partquip price list for parts currently available.

### Notes:

This catalogue replaces all previous issues. For older vehicles not covered in this issue, please refer to previous issues or contact your nearest Partquip branch. While every effort has been made to ensure that the information in this catalogue is correct at the time of printing, Partquip cannot accept any responsibility for errors, which may occur.

### Quality:

The manufacturing standards of all parts are very high and ensure the maximum degree of safety under all climatic conditions. It is necessary sometimes to manufacture parts that differ slightly in appearance from the old parts removed from a vehicle. In many cases these will be of improved, modern design and in all cases they will function as well as the parts replaced.

### Guarantee:

All goods are guaranteed for 12 months from date of purchase against defects arising from faulty material or manufacture/workmanship. This guarantee does not extend to defects caused by wear and tear, neglect or accidental damage. All goods are sold with the understanding that we cannot accept liability for consequential personal injury, damage or loss as a result of the misuse or incorrect fitment of our products.

### General:

All parts listed, sold or supplied are offered and sold as parts for replacement only. Vehicle or manufacturer names, descriptions, symbols and numbers listed in this catalogue are used for reference purposes only.

The contents of this catalogue are protected by copyright.

Unlawful use of the contents will result in prosecution.

## TAXI SLIDING DOOR BEARINGS

### FORD HUSKY & MITSUBISHI L300

Upper bearing	1 x 608 ZZ
Middle bearing	2 x 688 ZZ + 2 x 68334 - 95700
Lower bearing	1 x 608 ZZ + 1 x 607 ZZ

### MERCEDES-BENZ SPRINTER

Roller door bearing	1 x BKT010
---------------------	------------

### Nissan NV350

Upper bearing (with bracket)	1 x BKT013
Middle bearing (with bracket)	1 x BKT014
Lower bearing (with bracket)	1 x BKT015, 1 x BKT016

### TOYOTA HIACE 67-77 ("Katjiban")

Upper bearing	2 x 608 ZZ
Middle bearing	1 x 608 ZZ + 1 x 68334 - 95660
Lower bearing	1 x 608 ZZ

### TOYOTA HIACE 77-84 ("Super 10, Scorocoro")

Upper bearing	2 x 608 ZZ
Middle bearing	1 x 688 ZZ + 1 x 68334 - 95700
Lower bearing	1 x 608 ZZ

### TOYOTA HIACE 1984- ("Zola budd, TV 2, Tupperware, China eyes")

Upper bearing	1 x 608 ZZ
Middle bearing	1 x 688 ZZ + 2 x 68334 - 95700
Lower bearing	1 x 608 ZZ

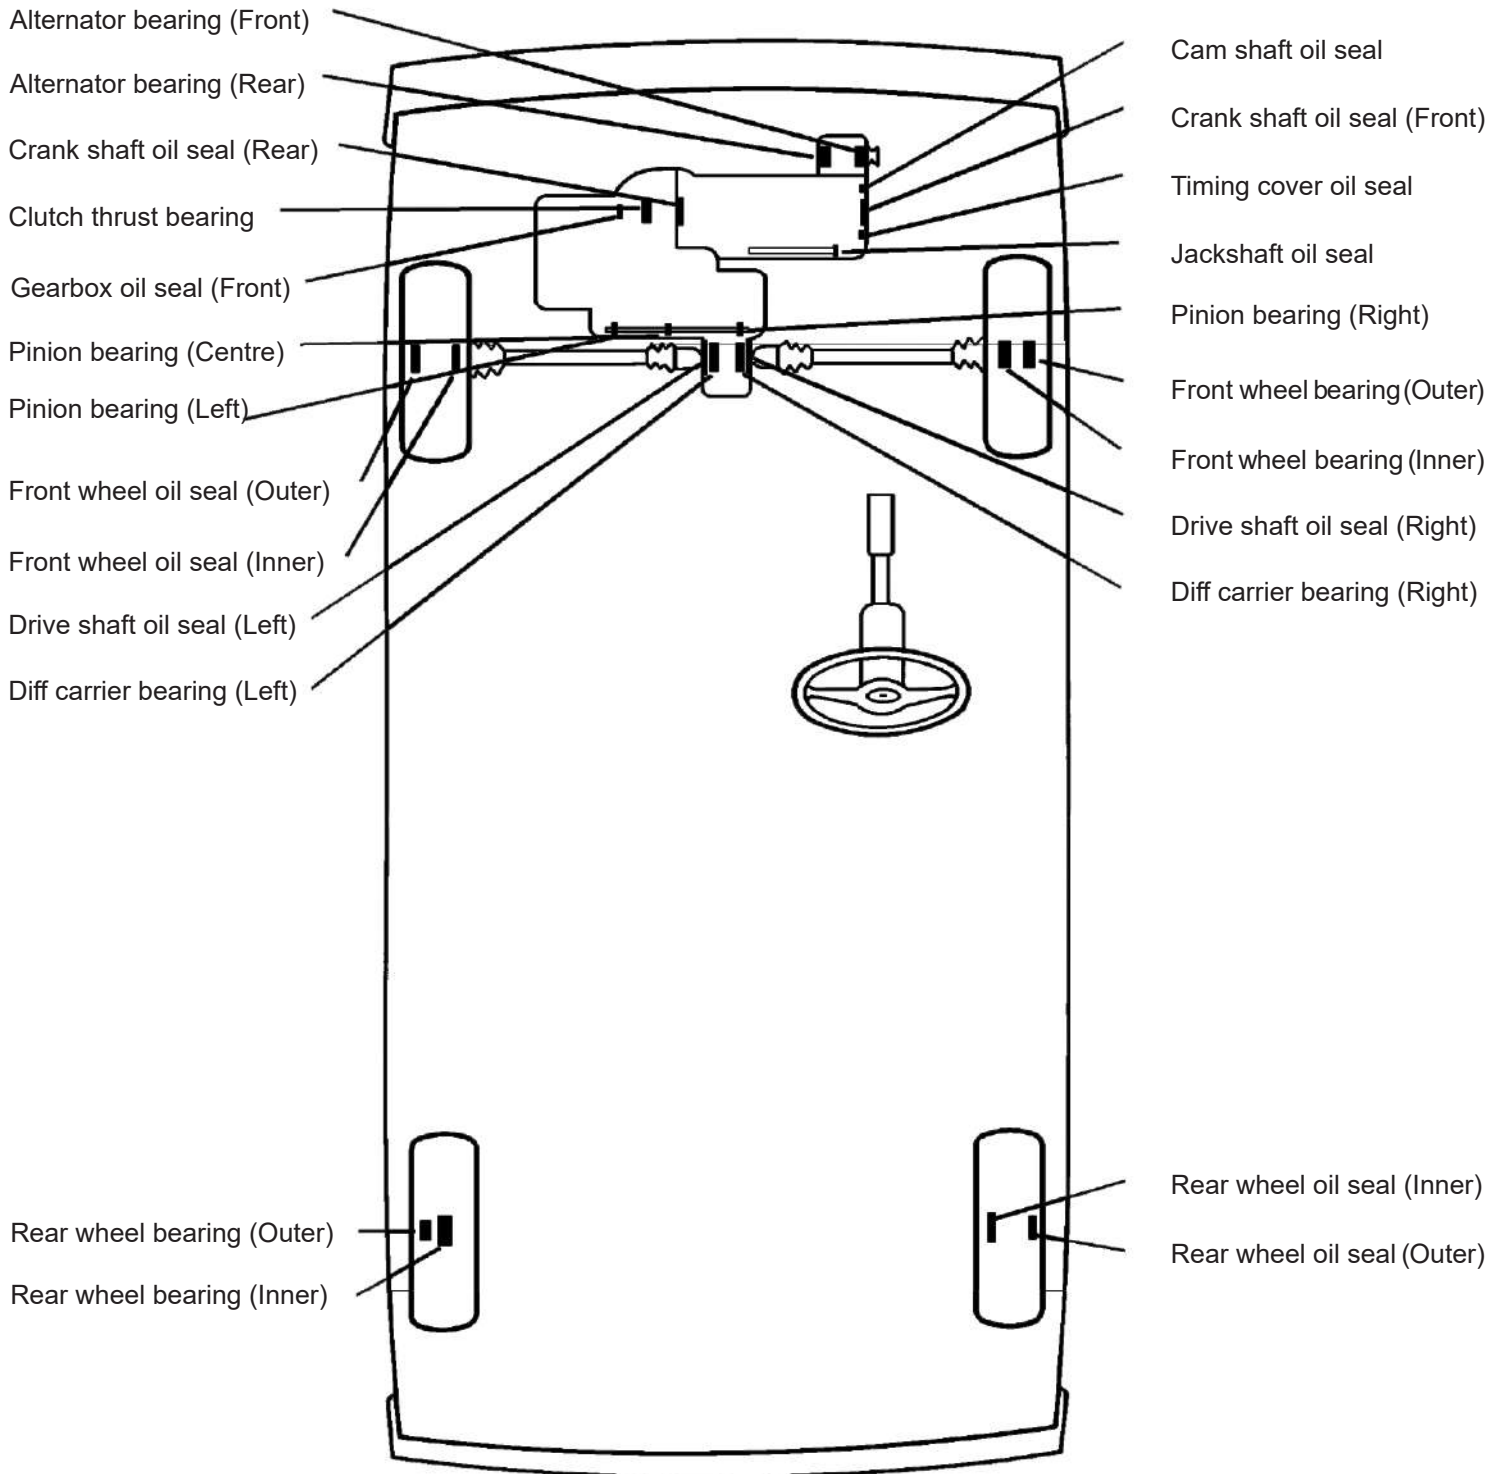

### TOYOTA QUANTUM

Upper bearing (No bracket)	1 x BKT007 (Top)
Upper bearing (with bracket)	1 x BKT007B (Top)
Side bearing (with bracket)	1 x BKT008 (Side)
Middle bearing (with bracket)	1 x BKT009 (Middle)

# BEARING GENERATION INFORMATION

## STANDARD BEARINGS

Tapered roller bearing

Tapered roller bearings can be dismantled, inner/outer rings can be separately installed. Tapered roller bearings provide a higher load-carrying capacity but with a limited speed range.

Single row deep groove ball bearing

Single row deep groove ball bearings have deep, uninterrupted raceway grooves. These raceway grooves have a close osculation with the balls, enabling the bearings to accommodate radial loads and axial loads in both directions.

### 1<sup>st</sup> Generation

### 1T Generation

Double-row angular contact ball bearing

Double-row angular contact ball bearings are compact bearing units for both front and rear passenger cars which support and bear high lateral forces during driving on round bends.

Double-row tapered roller bearing

Double-row tapered roller bearings are similar to 1<sup>st</sup> generation bearings, instead of balls, they use tapered rollers as rolling bodies. This increases the bearings capacity to support high axle loads and lateral acceleration.

### 2.1<sup>nd</sup> Generation

### 3<sup>rd</sup> Generation

Double-row angular contact ball bearing

Double-row angular contact ball bearings are 2nd generation compact bearing units that have the advantages of an integrated wheel flange for attaching the brake disc and wheel rim.

Double-row angular contact ball bearing

Double-row angular contact ball bearings are 3rd generation bearings and are highly integrated units with a mounting flange for a brake disc, wheel and wheel mount that guarantee high running accuracy, integrated speed sensors provide the required signal for ABS control.

### 3.1 Generation

### 3.2 Generation

Double-row angular contact ball bearing with axial splines

The drive torque is transferred between the wheel bearing and the axle journal by means of radial splines, which have a certain amount of clearance.

Double-row angular contact ball bearing with ABS Encoder

The magnetic pulse generator ring takes over the function of the ABS sensor ring, normally mounted on the wheel hub or drive shaft joint.

## ABS BEARING INFORMATION

3<sup>rd</sup> Generation HUB Bearings In The Automotive Industry Designed With a Magnetic ABS Pulse Generator

Gear type ABS pick up

Integrated ABS sensor; magnetic pick-up

Integrated ABS Sensor

Ladder Type ABS Pick-Up

Notes

## THE DIFFERENCE BETWEEN ABS AND ASB

### ABS

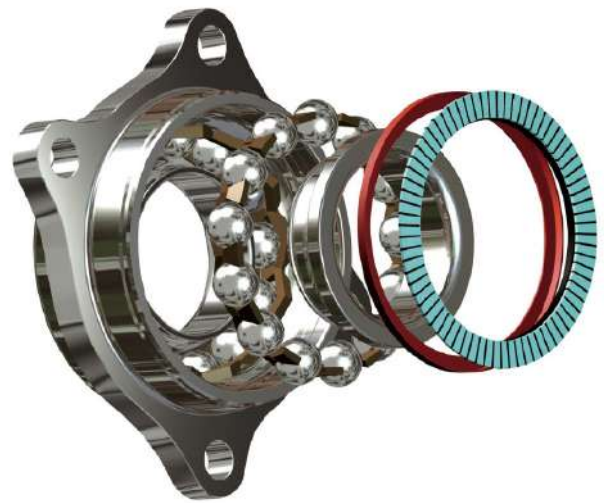

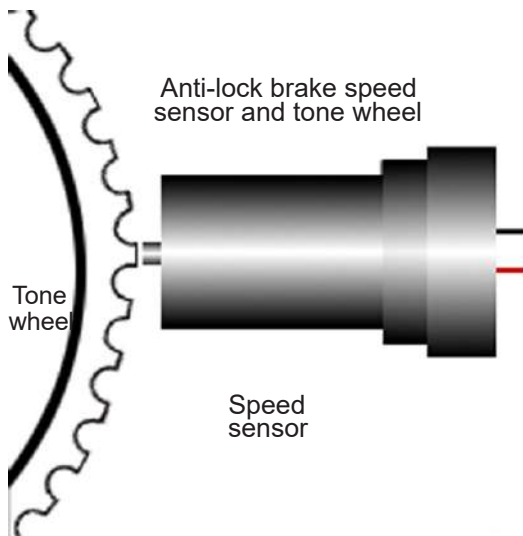

### ASB

#### “Anti-Lock Braking System”

#### “Active Sensor Bearing”

Simply indicates that a vehicle has been fitted with a system which prevents the wheels locking under heavy braking and therefore allows the driver to retain control of the vehicle.

This is the magnetic speed sensor on the bearing which enables the ABS system on the vehicle to determine whether or not the wheel's are rotating. This can be in the form of a seal on the “DAC” type bearing; or on additional sensor on Hub bearing units.

### The most common question asked from customers:

The “ABS light” does not want to go off?

See below possible reasons:

1. The “DAC” type bearing has been fitted the wrong way around, and the sensor cannot read the ASB seal.
2. There is damage to the ASB seal.
3. Another magnet has come into contact with the ASB seal, and has affected the magnets in the ASB seal.
4. There may be a manufacture fault (although this is rare as bearing speed sensors are tested at the factory during assembly)

Notes

## FITTING THE ABS DAC TYPE BEARING THE RIGHT WAY AROUND

Technological advancements have led to the ABS pick-up being integrated into the seal of bearings for later model applications.(Image 1)

In the case of double row angular contact ball bearings and double row tapered rollers bearings (pictured below), it's VITAL that the bearing is pressed into the steering knuckle so that the magnetic seal is in the correct position for the sensor to "read" the seal on the bearing.

An easy way to determine which side of the bearing has the magnetic ABS/ASB seal is to use a ferrous metal paper clip or split pin to see which side of the bearing it's attracted to.

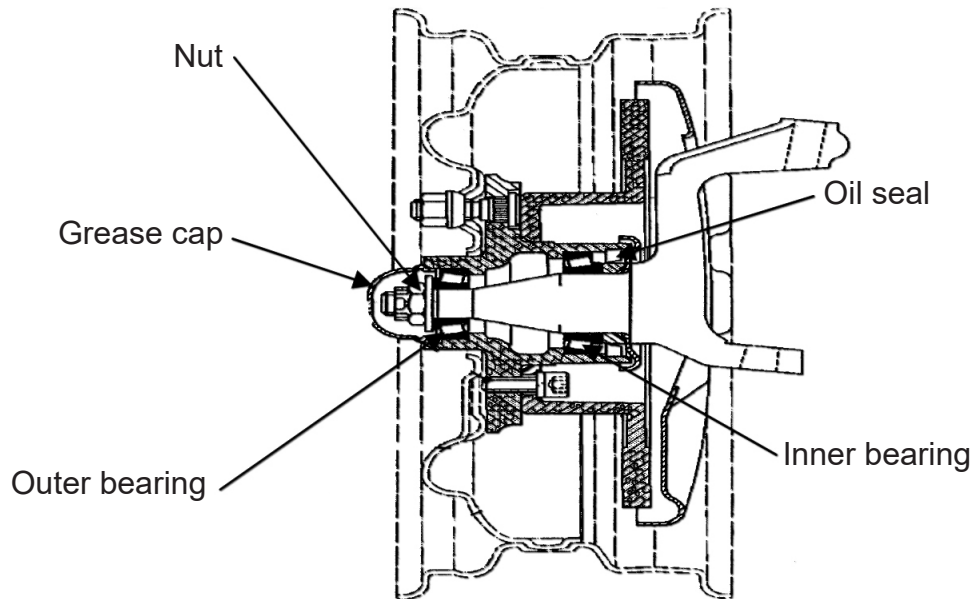

NB!!! Do not use any heavy metal objects to try and determine which side is magnetic, as this could damage the seal. Any damage to the seal will result in a faulty reading from the sensor.

The magnetic ABS/ASB seal can be identified by placing a lightweight metallic object (eg. paperclip) against the seals

Image 1

## BEARING FITMENT PROCEDURES

### Note:

It is important not to over-tighten your bearings or for that matter to under-tighten them. If there are any question of dust or dirt on the Bearings, it is advisable to wash them in petrol before proceeding as listed below.

Following these instructions will help you do the job correctly and extend bearing life:

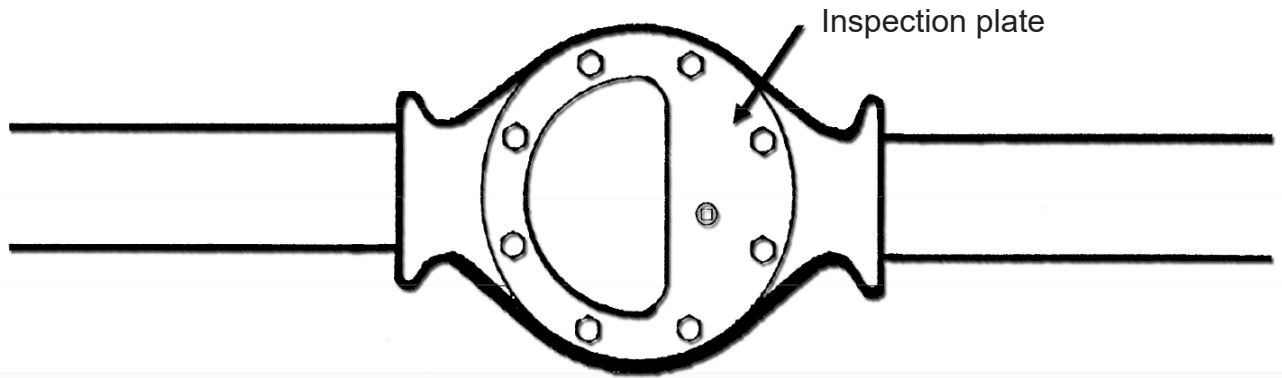

1	Insert the Cup of the inner bearing into the inside of the hub. Use the old Cup as a drift so as not to damage the new Cup, making sure it is the right way round.
2	Insert the Cup of the outer bearing into the outside of the hub as above.
3	Pack an approved type of grease into the cone of inner bearing. (Pack grease into the spaces between cage, cone and rollers)
4	Push the pre-greased inner cone into the inside of the hub.
5	Press Oil seal into inside of hub with sealing lips pointing towards bearing.
6	Mount hub on shaft carefully so as not to damage seal.
7	Apply grease freely to cone of outer bearing, and mount onto shaft.
8	Mount washer.
9	Fit castle or lock nut.
10	Tighten nut while the wheel is being rotated until drag is felt. (If available, follow repair manual instructions and use a torque wrench where applicable)
11	Back off nut approximately 1/12 turn, if castle nut, until alignment with the split pin hole is obtained. Then fit pin.
12	Check bearing for running smoothness and wobble. The wheel must not drag, but rotate freely. Be sure the wheel does not wobble!!
13	Mount grease cap.

Notes:

# PTFE OIL SEALS

## FITTING INSTRUCTIONS

1. Keep the oil seal free from dirt and other contaminants.
2. **Don't remove the inner fitment sleeve prior to assembly.** This sleeve is essential for fitting the seal correctly and avoiding damage to the edge of the seal. Should the sleeve be removed, and the sealing lip is bent or kinked, the seal will be rendered useless.
3. The PTFE sealing lip and the shaft onto which it's fitted, must be totally dry and free of oil and grease contamination. Do **NOT use grease or oil** to lubricate the seal or shaft!! Failure to adhere to this will result in a leaking oil seal!

4. The shaft surface must be totally free of any kind of imperfection such as nicks, scrapes or wear marks. If necessary, these should be corrected by an engineering professional prior to fitting the seal.
5. Use the inner sleeve to align the oil seal to the shaft. Once aligned, push the seal onto the shaft in one smooth movement. The inner sleeve may be discarded once the seal is in position.
6. Allow the seal to remain in position for at least **4 hours** before rotating the shaft (starting the vehicle)! The seal requires this time to assume the correct dimension of the shaft.
